Your domain model looks clean and nice.
The structure looks very good and makes it easy to see how the different cases connect to each other. The associations used within your model looks good.
Your model makes correct use of available attributes within classes.

However, there are a few points worth noting:

1 –   You seem to miss a few cases in your model, such as booking (for a berth), register (for a boat)

2 –   Text alignments such as "Collects", "Pays", "Assigned". "Owns" and "Placed" are located on the lines itself, try to place these texts not on the lines.

3 –   The classes are missing attributes, to to include more details. For example, what does the calender case do or what attributes does it have? The calender should for example have a start time and a ending time as attributes. But make sure you are not overdoing the details.

A point worth noting out:
You state in your model: "We Assume a programmer knows that Event is date based and a calendar also is so we did not model the attributes and relations.". While this is true, it should still be included, it should not take more than 4 rows of attributes as assigned by the requirements of the workshop. Operations are of course not required to include.

In short:
I think your model would pass for grade 3, if you try to improve these points. Most important thing worth noting is that it should contains more details and cases. It seems that a domain expert such as a secretary can easily read your model.

The bottom line:
Improve your model with using some small adjustments and corrections, as listed in my points above, which should not be to hard or take to long to improve upon.
